## Organizing Change in large SAP landscapes

If you start a new rollout or implementation project you might be interested in organizing change control process for your SAP landscape. It's quite simple if you have 3 tier system landscape but project team can require you to build more systems on different version to perform the proper testing and parallel development.

Sometimes the rollout activity must be synchronised with EHP/SPS installation and support team is performing hot fixes on current release. In such situation the system landscape can grow up to 20+ system for only one SAP application. We know how to manage changes in such situation.

SBAS consulting can help you to organize STMS domain of any scale and based on different SAP\_BASIS versions. We will advice you the best approach for your particular situation that will help you to bring the changes timely and safely to production system.

For complicated system landscapes SBAS Consulting suggests to implement change control and process automation tool to make your change management process more efficient.

**Rev-Trac** from Revelation Software Concepts can save you a lot of time, aimed to automate and control the change transportation in large SAP landscapes. It allows you to build the flexible workflow process with approval steps, helps to document all of the changes and provides a bunch of useful tools/reports for your SAP analysts and ABAP developers.

It does not replace but manage the standard STMS functionality on high level, helping you to store all change documentation and activity history at one place.

If you already have the Rev-Trac installation we can consult you on most useful features, help to optimize/simplify the process in order to satisfy all business requirements in SAP change management.

Contact us to know more details.
